# Objective

Apply and compare edge detection methods using Python and OpenCV, and investigate how parameter changes affect the detected edges.

### Task 1: Apply Edge Detection Methods

1. Select a new image of your choice. Do not use the image provided in the original notebook.
2. Apply the following methods to your selected image using the provided notebook as a reference:
    - Sobel Edge Detector
    - Prewitt Edge Detector
    - Canny Edge Detector
3. Display the original image and the three resulting edge maps.

### Task 2: Investigate the Effect of Canny Thresholds

1. Apply Canny edge detection using the following threshold pairs:
    - Low = 30, High = 90
    - Low = 50, High = 150
    - Low = 100, High = 200
2. Display the three resulting edge maps side by side.
3. Explain how changing the thresholds affects the number of detected edges and the visibility of image details.

# Submission Requirements

- Submit your solution as a **Jupyter Notebook (`.ipynb`) file and PDF**.
